North Korea's Crypto Hackers Are Paving the Road to Nuclear Armageddon
North Korea has quietly become a cryptocurrency superpower. It has stolen billions in bitcoin and ether and is funneling profits to its nuclear weapons program.

Introduction

- State actors and other black hats are hacking crypto ecosystem projects to further geopolitical and monetary goals, using tried and true methods from web2 cybersecurity.

- Black hats leverage exploits not just of smart contracts but of surrounding off-chain infrastructure to include key management, front end, cloud security, insider threat, and OPSEC attacks.

- This panel will address end to end security risks that projects need to consider

- The security of web3 projects needs to include assessing web2 risk!
